German defense industry: structure and dynamics What follows, is my opinion about the general design concept of the Germany's defense industry.

This design presupposes few conditions that, currently, are not satisfied at all. It is expected that, in the near future, they shall become satisfied. Until then, no actual modification of the existing structure should be attempted.

A co-centric, multi-layer structure should be adopted.

The peripheral layer manages the products' exports to foreign clients while, the core layer manages, exclusively, the secret, defense means which are intended, exclusively, for the Germany's military defense.

The flow of vital information goes one-way, meaning, from the peripheral layers towards the core layer and never vice versa.

The core layer should be geographically fragmented to many, small parts, spread at the area between, Braunschweig, Leipzig and Frankfurt am Main and made as less identifiable as possible.

A dedicated, with exclusive communication protocol, data network should be made.

The proposed defense industry's rough, design concept is suitable for a leading Nation which is, most probably, going to undertake large responsibilities towards contributing to the normalization of the current, international "unrest".

Christos Boumpoulis

economist

P.S.:

It is imperative that, no changes should be attempted before the related prerequisites become satisfied. More details shall follow in due course.
